We sought to evaluate the effect of acoustic ventilation on survival, health-care costs and on the quality of life of critically ill patients. Acoustic ventilation is the use of a sensor placed in the mouth of the patient to detect carbon dioxide (CO_2) levels in exhaled air, which triggers the release of oxygen by an electronic valve. A hospital-wide implementation of acoustic ventilation in an intensive care unit (ICU) was performed. The impact of acoustic ventilation on survival, health-care costs and quality of life was evaluated. A total of 645 patients were enrolled in the study; 31.9% of patients had a respiratory failure. Acoustic ventilation was associated with a significant survival benefit (10.3 versus 14.3%; P = 0.004). Patients treated with acoustic ventilation had a significant reduction in length of hospital stay (9.3 versus 13.2 days; P a1d647c40b

I loved seeing all the fun people from all over the world who came to the event and bought the book. Also, the staff at the library were extremely kind, patient, and accommodating. They provided excellent service, which kept
